

# Just a Few Days Left!

When: Saturday, April 18th from 10 am - 12 am (MIDNIGHT)

Where: Sitterson and Fred Brooks 1st floor (Floor 0)

- Please confirm your attendance by responding to the official Hack110 email.
- Be on the lookout for an email to join the Hack110 GroupMe
- **Don't want to make a project or stay the full time?** We have plenty of workshops throughout the day to benefit you in multiple ways!
- Still time to sign up. Don't Wait!

Website!

Questions? Email [hack110@office.unc.edu](mailto:hack110@office.unc.edu)

# Perks

Lunch catered by **Panera**

Dinner catered by **Kolapasi**

**Free Hack 110 Shirt**

**Free Snacks and Drinks Throughout**

Earn **CLE credit**

**Win Vouchers for UNC's best cafe: Tea Hill**

Compete to **win many amazing prizes!**

# Select a Prize from the Pool

Laptop Stand

Newton's Cradle

Portable Fan

Wireless Keyboard

Galaxy Projector

Survival Kit

Power Banks

Volcano Lamp

Tile Tracker

Phone Mount

# Analyzing Data from a CSV in a Jupyter Notebook

Get ready to code with me in VSCode,  
or take notes on what the code I'm writing does!

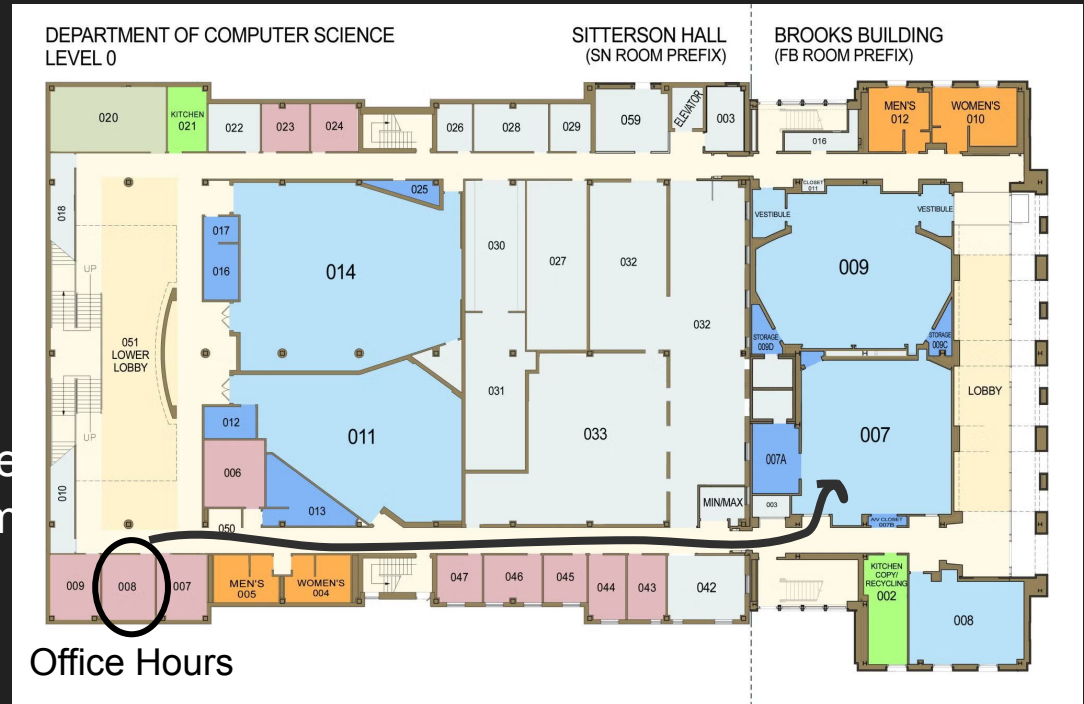

# Announcements

## Re: Assignments:

- **EX08: Linked List Utility Functions** due at 11:59pm tonight

## Quiz 03 this Friday! To prep:

- Review your previous quiz(es)
- Practice problems on the website
- Hybrid review session today from 6:30-7:30pm in Fred Brooks, room 007 + online

# We've covered a LOT in this course thus far...

- Objects
  - Data types
  - Expressions
  - Functions
  - Memory diagrams
  - Boolean expressions
  - Conditionals
  - Scope
  - User input
  - While loops
  - For loops
  - Importing modules
  - Lists
  - Unit tests
  - Dictionaries
  - Object-oriented prog.
  - Magic methods + operator overloading
  - Recursive structures
  - Recursive functions/methods
- (and more...)

Now, it's time to take these ideas and put them to use by analyzing real-world data!

Think about your major(s) or a potential career path...

What data might you need to gather, track, or analyze?

**Think**

Think of one specific example.

**Pair**

Share with a partner. What would the columns hold? Would you need categorical/numeric data?

**Share**

We'll hear from a few pairs

# EX09: Data Analysis for Continuous Improvement

For your last exercise, you will be analyzing the anonymized data from the class survey (LS16) to make evidence-based recommendations regarding how we can improve the course in the future!

This assignment will require you to:

we'll introduce these today!

- Read a CSV of data in Python
  - Use “helper” functions to wrangle the data
  - Analyze the data
  - Generate figures summarizing the results of your analysis
    - (with the help of a library called `seaborn`!)
  - Summarize your work and findings on your own website
- 

New skills!

Let's analyze Raleigh weather data and Walter Wally's predictions to see how accurate his winter weather forecasts are!

(Walter Wally is Raleigh's version of Punxsutawney Phil!)

## Today's agenda:

1. Review CSV structure
2. Introduce Jupyter Notebooks
  - a. Markdown cells (formatted text)
  - b. Python cells (code)
3. Read CSV data
4. Wrangle data

## Next week:

1. More data-wrangling
2. Analyze data
3. Read documentation/use Python packages and libraries

# What is a CSV?

A .csv file stores tabular data as plain text. Each line is a row, and values in that row are separated by commas.

column

column headers →

row of data →

year	temp	result
2018	48.24	no shadow
2019	46.63	shadow
2020	52.50	shadow
2021	45.86	no shadow
2022	50.36	shadow

The diagram shows a CSV file structure with annotations. A yellow oval highlights the first column, and a pink oval highlights the first row. A pink arrow points from the text 'column headers' to the first row, and a cyan arrow points from 'row of data' to the first row. The word 'column' is written in yellow above the first column. The data is as follows:

year	temp	result
2018	48.24	no shadow
2019	46.63	shadow
2020	52.50	shadow
2021	45.86	no shadow
2022	50.36	shadow

# What is a CSV?

A .csv file stores tabular data as plain text. Each line is a row, and values in that row are separated by commas.

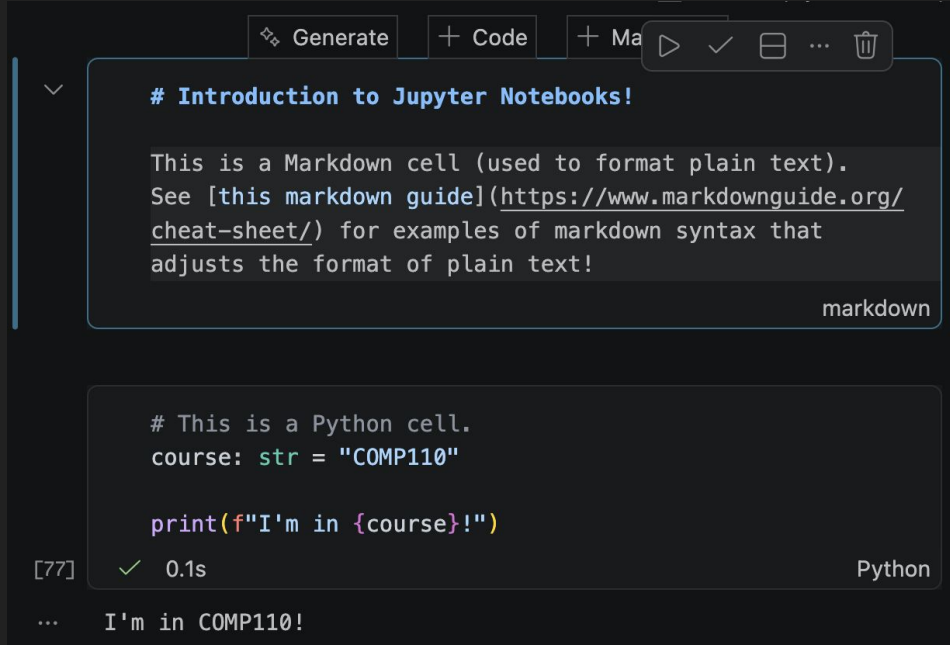

In your VSCode workspace:

1. Create a directory (folder) called `data_analysis`
2. In `data_analysis`, create a directory called `data`
3. In your `data` directory, create a file called `walter_wally.csv`
4. Copy the data to the right, and paste it into `walter_wally.csv`
5. Save the .csv file

```
year,temp,result
2018,48.24,no shadow
2019,46.63,shadow
2020,52.50,shadow
2021,45.86,no shadow
2022,50.36,shadow
```

# What is a Jupyter Notebook?

An .ipynb file mixes live Python code, rich text, and output, all in one document. Instead of running an entire script at once, you execute small chunks (“cells”) and see output immediately below each cell.

The screenshot shows a Jupyter Notebook interface with a dark theme. At the top, there are buttons for 'Generate', '+ Code', '+ Ma', and a toolbar with icons for play, check, close, and trash. The first cell is a Markdown cell with the following content:

```
# Introduction to Jupyter Notebooks!  
  
This is a Markdown cell (used to format plain text).  
See [this markdown guide](https://www.markdownguide.org/  
cheat-sheet/) for examples of markdown syntax that  
adjusts the format of plain text!
```

The cell is labeled 'markdown' in the bottom right corner. The second cell is a Python cell with the following content:

```
# This is a Python cell.  
course: str = "COMP110"  
  
print(f"I'm in {course}!")
```

The cell is labeled 'Python' in the bottom right corner. Below the Python cell, there is a status bar showing '[77] ✓ 0.1s' and the output 'I'm in COMP110!'.

In your VSCode workspace:

1. In `data_analysis`, create a new file called `analysis.ipynb`

# What is a Jupyter Notebook?

Let's try it!

An .ipynb file mixes live Python code, rich text, and output, all in one document. Instead of running an entire script at once, you execute small chunks (“cells”) and see output immediately below each cell.

```
# Introduction to Jupyter Notebooks!  
  
This is a Markdown cell (used to format plain text).  
See [this markdown guide](https://www.markdownguide.org/  
cheat-sheet/) for examples of markdown syntax that  
adjusts the format of plain text!  
  
markdown
```

```
# This is a Python cell.  
course: str = "COMP110"  
  
print(f"I'm in {course}!")  
[77] ✓ 0.1s Python  
... I'm in COMP110!
```

## Using Notebooks in VS Code

1

### Open or create an .ipynb file

*New file... → name it <anything>.ipynb*

2

### Select your Python kernel

*Click the kernel picker (top right) → select a Python version*

3

### Add a cell

*Click "+ Code" or "+ Markdown" in the toolbar*

4

### Run a cell

*Click  or press Shift + Enter*

5

### Run all cells

*Kernel → Restart & Run All (clears old outputs first)*

# Markdown in Jupyter Notebooks (Cheat Sheet [here!](#))

Syntax	Renders as
<code># Heading 1</code>	<b>Large section title</b>
<code>## Heading 2</code>	<b>Subsection title</b>
<code>**bold text**</code>	<b>bold text</b>
<code>*italic text*</code>	<i>italic text</i>
<code>- item\n- item</code>	<ul style="list-style-type: none"><li>• Bulleted list</li></ul>
<code>1. first\n2. sec</code>	<ol style="list-style-type: none"><li>1. Numbered list</li></ol>
<code>`inline code`</code>	monospace snippet

Let's write a function to help us read and wrangle the data!

## `read_csv_rows`

`read_csv_rows` should read an entire CSV of data and return it as a list of rows, where each row represents a `dict[str, str]`.

- Function Name: `read_csv_rows`
- Parameter:
  - `str` path to CSV file
- Return Type: `list[dict[str, str]]`

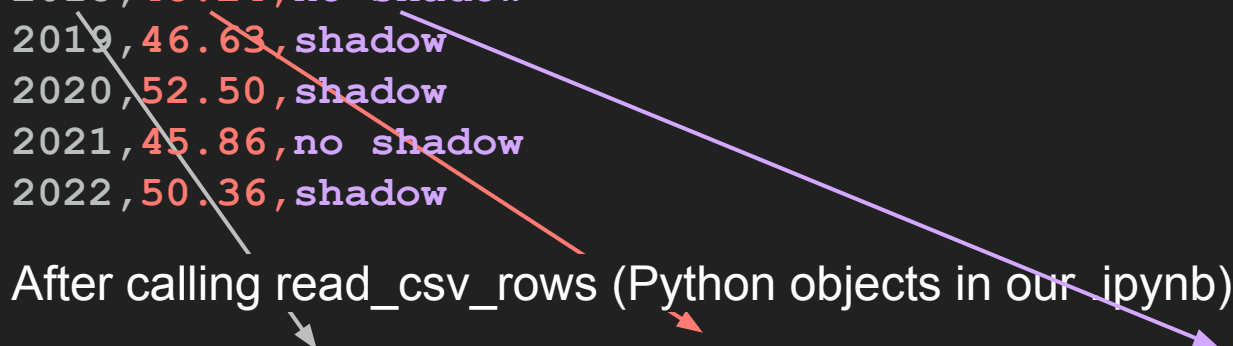

Let's call it to read our CSV data and convert them to a `list[dict[str, str]]`

# read\_csv\_rows

Before calling read\_csv\_rows (data in our .csv):

```
year,temp,result
2018,48.24,no shadow
2019,46.63,shadow
2020,52.50,shadow
2021,45.86,no shadow
2022,50.36,shadow
```

After calling read\_csv\_rows (Python objects in our ipynb):

```
[{'year': '2018', 'temp': '48.24', 'result': 'no shadow'},
 {'year': '2019', 'temp': '46.63', 'result': 'shadow'},
 {'year': '2020', 'temp': '52.50', 'result': 'shadow'},
 {'year': '2021', 'temp': '45.86', 'result': 'no shadow'},
 {'year': '2022', 'temp': '50.36', 'result': 'shadow'}]
```

# read\_csv\_rows (solution)

```
def read_csv_rows(filename: str) -> list[dict[str, str]]:
    """Read the rows of a CSV into a 'table'."""
    result: list[dict[str, str]] = []

    # Open a handle to the data file
    file_handle = open(filename, "r", encoding="utf8")

    # Prepare to read the data file as a CSV rather than just strings.
    csv_reader = DictReader(file_handle)

    # Read each row of the CSV line-by-line
    for row in csv_reader:
        result.append(row)

    # Close the file when done, to free its resources.
    file_handle.close()

    return result
```
